# FINANCIAL TRANSACTION AND LOANS DASHBOARD

Project Report

Prepared using Microsoft Power BI

Submitted By

Name: Chandni

Tool Used: Microsoft Power BI Desktop

Dashboard documentation based on the supplied screenshots

# 1. Introduction

This project presents a Financial Transaction and Loans Dashboard built in Microsoft Power BI. It brings account information, loan status, monthly transaction activity, transaction types, and transaction values into a single overview for quick review.

The dashboard is intended to make financial activity easier to monitor by combining high-level KPI cards with charts, a transaction summary table, and interactive filters.

# 2. Objectives

• Review account counts by account type.
• Track transaction totals by month.
• Compare loan statuses.
• Compare transaction values by transaction type.
• Review transaction counts and values in a summary table.
• Filter the dashboard by year, account type, and transaction type.

# 3. Dataset Description

The screenshots indicate a financial dataset with account, loan, and transaction information. Visible fields and labels include Account Type, StatusName, Month, Year, transaction TypeName, Total Transactions, and Transaction Value. The full underlying schema and source of the dataset are not visible in the screenshots.

# 4. Dashboard Overview

The Finance Overview page combines account-type distribution, a monthly transaction trend, loan status proportions, transaction values by type, and a transaction summary table. Slicers on the right allow the report to be filtered by year, account type, and transaction type.

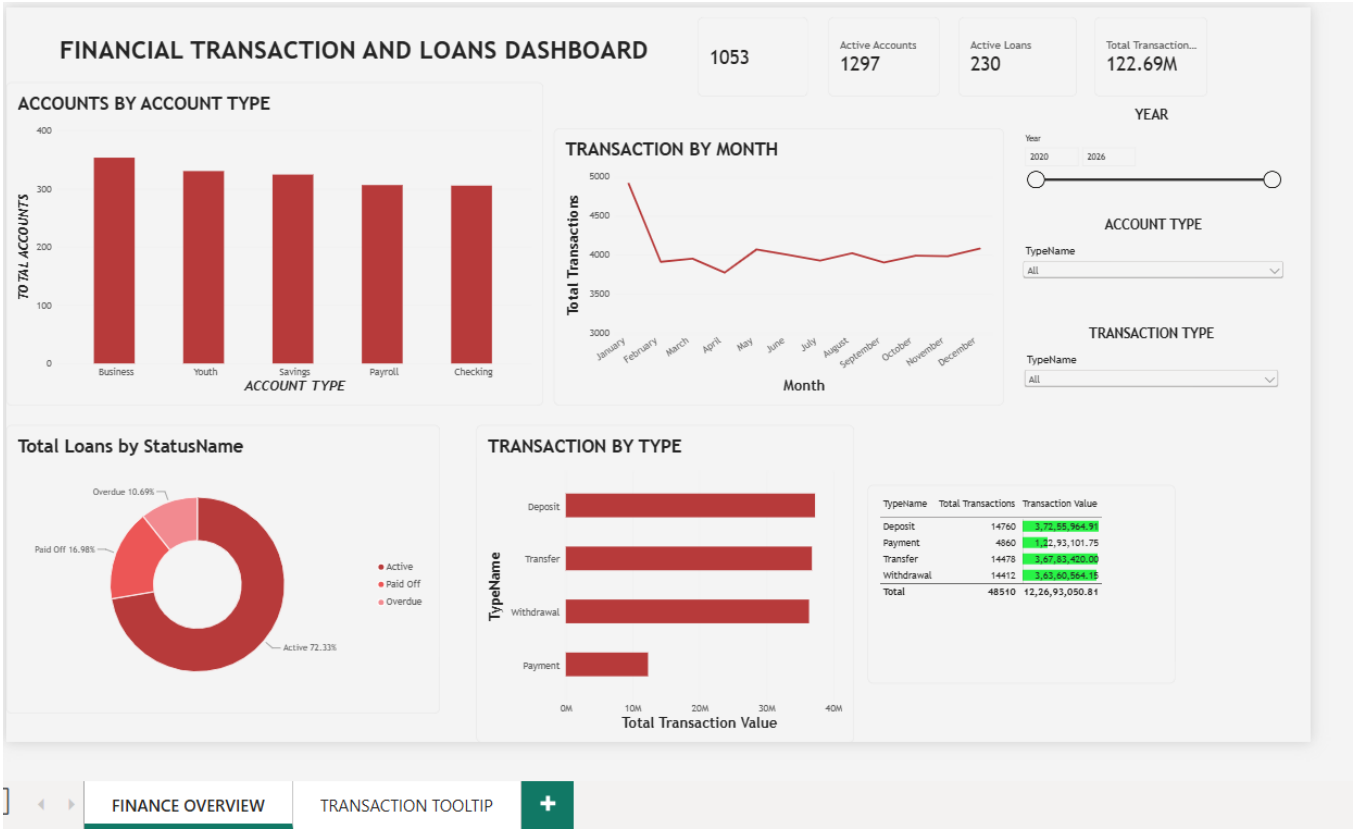

Figure 1: Finance Overview dashboard showing account, loan, and transaction visuals.

## 5. KPI Cards and Headline Metrics

| Metric | Displayed value | Interpretation |
|---|---|---|
| Accounts (headline card) | 1,053 | A top-level count displayed on the dashboard; the exact card label is not legible. |
| Active Accounts | 1,297 | Count shown on the Active Accounts card. |
| Active Loans | 230 | Count shown on the Active Loans card. |
| Total Transaction Value | 122.69M | Aggregate transaction value displayed in the KPI card. |
| Total Transactions | 49K | Shown in the second supplied screenshot. |

Note: The screenshots display both a value of 1,053 and an Active Accounts value of 1,297. These are reproduced as shown rather than reconciled because the underlying measure definitions are not available.

## 6. Accounts by Account Type

The column chart compares total accounts across five account types: Business, Youth, Savings, Payroll, and Checking. Business is the tallest bar, followed by Youth and Savings. Payroll and Checking appear slightly lower and close to one another. Exact bar values are not printed on the chart, so the comparison is qualitative.

## 7. Transactions by Month

The monthly line chart covers January through December. Transaction volume begins at a high point in January, drops sharply in February, then fluctuates through the rest of the year. The series shows a small rise in May, dips and recoveries across the middle months, and finishes somewhat higher in December than in November.

## 8. Total Loans by Status

The donut chart divides total loans into three displayed statuses: Active (72.33%), Paid Off (16.98%), and Overdue (10.69%). Active loans make up the largest share in the displayed breakdown. The chart describes status proportions; it does not by itself show loan balances or the financial amount associated with each status.

## 9. Transaction by Type

The horizontal bar chart compares transaction value for Deposit, Transfer, Withdrawal, and Payment. Deposit, Transfer, and Withdrawal have the longest bars and appear relatively close to one another, while Payment is substantially lower. The table beside the chart provides transaction counts and transaction values by type.

## 10. Transaction Summary Table

| Transaction type | Total transactions | Transaction value (as displayed) |
|---|---|---|
| Deposit | 14,760 | 3,72,55,794.91 |
| Payment | 4,860 | 1,22,93,101.75 |
| Transfer | 14,478 | 3,67,82,420.00 |
| Withdrawal | 14,412 | 3,63,60,564.15 |
| Total | 48,510 | 12,26,93,050.81 |

The table values are transcribed from the supplied screenshot. The total row displays 48,510 transactions and 12,26,93,050.81 in transaction value. The KPI card rounds the transaction count to 49K and the value to 122.69M.

## 11. Filters and Interactivity

The Finance Overview page contains three visible filter controls:

• Year — a range selector showing 2020 and 2026 as the visible endpoints.
• Account Type — a dropdown labelled TypeName, initially showing All.
• Transaction Type — a dropdown labelled TypeName, initially showing All.

These controls are intended to let users narrow the dashboard by time period, account type, and transaction type. The screenshots show the controls but do not demonstrate specific filter selections or their resulting effects.

## 12. Additional Screenshot: Transaction Tooltip Page

The second screenshot appears to show a separate or tooltip-focused report view with KPI cards for Total Transaction Value (122.69M) and Total Transactions (49K). Much of the canvas is blank, and the screenshot does not reveal further chart detail. This report therefore documents only the visible cards and does not infer additional functionality.

Figure 2: Supplied transaction tooltip / KPI view.

## 13. Key Findings

• The dashboard displays 1,053 on one headline card, 1,297 Active Accounts, and 230 Active Loans.
• Total transaction value is displayed as 122.69M, with total transactions rounded to 49K.
• Business is the largest displayed account type by account count.
• Active loans represent 72.33% of the displayed loan-status distribution.
• Deposit, Transfer, and Withdrawal show much higher transaction values than Payment.
• January is the highest visible point in the monthly transaction trend, followed by a sharp decline in February.

## 14. Conclusion

The Financial Transaction and Loans Dashboard consolidates account distribution, loan status, monthly transaction activity, and transaction-type comparisons into a single Power BI overview. The visuals support a quick review of headline metrics and patterns. More detailed validation would require the underlying dataset, measure definitions, and

confirmation of the labels behind the 1,053 and 1,297 account figures.
